PART I: Analysis

1 Problem Definition and Data Requirements

1.1 Problem Description

These days technology has been by our side making our lives easier and saving us time. Through technology, we are able to create a quality database design to satisfy the needs of a tech store that sells electronic devices and equipment and provides different kinds of services online and offline. In this project, we aim to live up to the expectations of our customers/workers and ease their demands.

1.2 Data Requirements

Entities and their attributes:

- 1. Employee:**
 - o Primary key: id.
 - o name.
 - o Date of Birth.
 - o Shift time
 - o Salary
 - o Hours worked
- 2. Technician:** subclass of Employee inheriting all its attributes with addition of:
 - o degrees
- 3. Delivery Person:** another subclass of Employee inheriting all its attributes with addition of:
 - o driver's licence number.
- 4. Customer:**
 - o Primary key: phone number.
 - o Name
 - o Date of birth
 - o Address
- 5. Device:**
 - o Primary key: Device serial number.
 - o Name
 - o Company
 - o Type
 - o Color
 - o Edition

- o Price
- o Storage
- 6. Supplier:**
 - o Primary key: id.
 - o Name
- 7. Membership:**
 - o Primary key: id.
 - o Total points
 - o Expiration date
- 8. Spare piece:**
 - o primary key: id.
 - o Type
 - o Price
 - o Compatibility(Edidti, name, company)
- 9. Store:**
 - o primary key: Store number.
 - o Working hours
 - o Online store pick-up booth
- 10. Delivery:**
 - o primary key: order number.
 - o Estimated date
 - o shipping fee
 - o Package weight
- 11. Warranty:** weak entity
 - o primary key: device serial number and type.
 - o expiration date
 - o Cost
- 12. Service:**
 - o primary key: id
 - o Type (1- replacing the battery, 2- replacing the screen, 3- new device set-up, 4- diagnostics)
 - o Cost
 - o Duration

1.3 Business Rules

- Each employee may have a supervisor, and each employee could be a supervisor.
- Each employee works in a store, and each store must have employees.
- Each store has a manager, each manager manages one store.
- Employee types are Technician and Delivery Person. An employee can be of one type or neither, but not both.
- Only one customer can order a particular device with a particular delivery.

- Each delivery is delivered by one Delivery Person, a Delivery Person can deliver multiple deliveries.
- Each customer can have one membership, each membership must belong to only one customer.
- a customer can purchase one or more devices, a device could be purchased by only one customer.
- Each device could include 0 or more warranties, each warranty is included in one device only.
- Each supplier can supply multiple devices, each device of a certain company is supplied by one supplier.
- Each supplier can supply multiple spare pieces, each spare piece is supplied by one supplier.
- A technician can perform multiple services, a service is performed by one technician.
- Each customer can request multiple services, each service is requested by one customer.

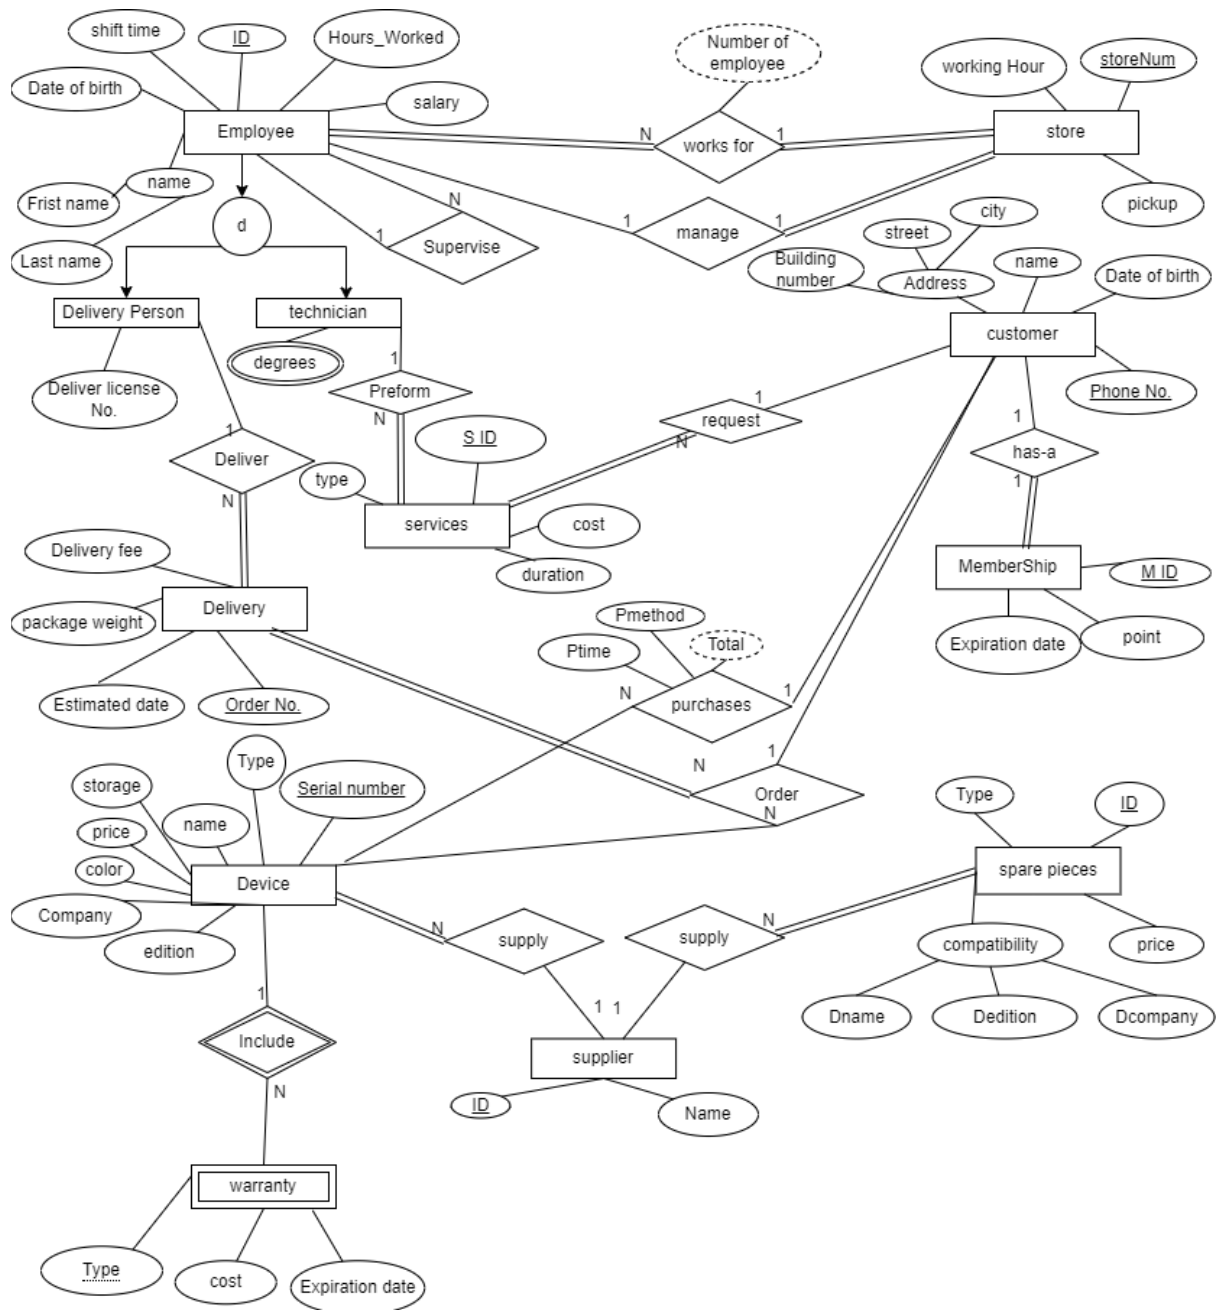

1.4 Intended Output of the System

- Calculate the total cost with the additional services.
- Calculate the discount amount using points from a customer membership.
- Check availability of a device or a spare piece across all stores.
- Renew customers' membership by updating the expiration date and incrementing the version attribute.
- Retrieve all stores that are open at a specific time.
- Retrieve all deliveries due today along with their assigned Delivery Person's employee ID.
- Retrieve a table containing all registered orders' numbers and the customer's phone number and the customer's address for a specific Delivery Person.
- Retrieve all services with pick-up dates that are within a week along with their designated Technician.
- Retrieve all customers who either purchased or ordered a device that includes an active warranty.

PART II: DB DESIGN

2 ER Diagram Design

2.1 ER Diagram

2.2 Design of Business Rules

Business Rule	Design Decisions	Justification (if any)
Each employee may have a supervisor, and each employee could be a supervisor.	Partial participation on both sides of supervise relationship. one-to-many constraint for supervisor and supervisee respectively.	
Each employee work in a store, each store must have employees	Total participation on both sides of work for relationship. many-to-one constraint for Employee and store respectively.	
Each store has a manager, each manager manages one store.	Relationship manage with total participation on the store side and partial participation on the employee side.	
Types of employees are Technician and Delivery Person. an employee can be of one type or neither, but not both.	Subclasses technician, and delivery Person. partial specialization displayed by a single line from superclass to subclasses. disjointness constraint.	The partial specialization is because a technician and a delivery person are two job types that are distinguished by degree and Driver's Licence number respectively, while other employees are stored in the database as regular employees even if they are assigned a particular job in real life.
Only one customer can order a particular device with a particular delivery.	ternary relationship order with one-many-many constraint for customer, device, and delivery, respectively.	
Each delivery is delivered by one Delivery Person, a Delivery Person can deliver multiple deliveries.	Relationship Deliver with total participation on the delivery side and partial participation on the Delivery person side. one-to-many constraint for Delivery person and Delivery respectively.	

Each customer can have one membership, each membership must belong to one customer.	Relationship Has-a with total participation on the membership side and partial participation on the customer side. one-to-one constraint.	The partial participation on the customer side is because although signing up for a membership is free, it is still optional.
A customer can purchase one or more devices, a device could be purchased by only one customer.	Partial participation on both sides of Purchases relationship many-to-one constraint for Device and customer respectively.	
Each device could include 0 or more warranties, each warranty is included in one device only.	Relationship Includes with total participation on the warranty side and partial participation on the Device side. one-to-many constraint for Device and Warranty respectively.	
Each supplier can supply multiple devices, each device is supplied by one supplier.	Relationship Supply with total participation on the Device side and partial participation on the Supplier side. one-to-many constraint for Supplier and Device respectively.	
Each supplier can supply multiple spare pieces, each spare piece is supplied by one supplier.	Relationship Supply with total participation on the Spare_Pieces side and partial participation on the Supplier side. one-to-many constraint for Supplier and Spare_Pieces respectively.	
A technician can perform multiple services, a service must be performed by one technician.	Relationship Perform with total participation on the Service side and partial participation on the Technician side. one-to-many constraint for Technician and Service respectively.	

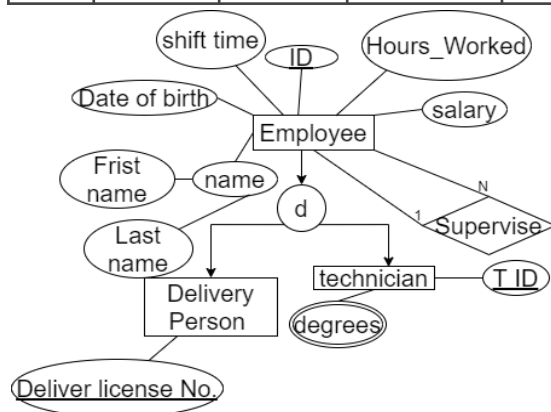

Each customer can request multiple services, each service is requested by one customer.	Relationship Request with total participation on the Service side and partial participation on the Customer side. one-to-many constraint for Customer and Service respectively.	
---	---	--

3 ER-to-logical Schema Mapping

3.1 Mapping of Regular Entity Types

Employee:

<u>ID</u>	Fname	Lname	Date of birth	Hours_worked	Shift time	salary
-----------	-------	-------	---------------	--------------	------------	--------

Technician is a subclass of Employee:

Technician:

<u>EID</u>

FK EID → Employee ID

Delivery person is a subclass of Employee:

Delivery person:

driver_licenseNo	<u>EID</u>
------------------	------------

FK EID → Employee ID

Store:

working_hours	<u>storeNum</u>	pick_up
---------------	-----------------	---------

Customer:

<u>Phone number</u>	name	Date of birth	apt_number	City	street	Building number
---------------------	------	---------------	------------	------	--------	-----------------

Delivery:

<u>orderNo.</u>	estimated_date	delivery_fee	package_weight
-----------------	----------------	--------------	----------------

Membership:

<u>MID</u>	expiration_date	points
------------	-----------------	--------

Services:

<u>SID</u>	type	duration	cost
------------	------	----------	------

Device:

<u>Serial_number</u>	name	type	company	color	price	storage	edition
----------------------	------	------	---------	-------	-------	---------	---------

Spare pieces:

<u>ID</u>	Dname	edition	Dcompany	Price
-----------	-------	---------	----------	-------

Supplier:

<u>ID</u>	name
-----------	------

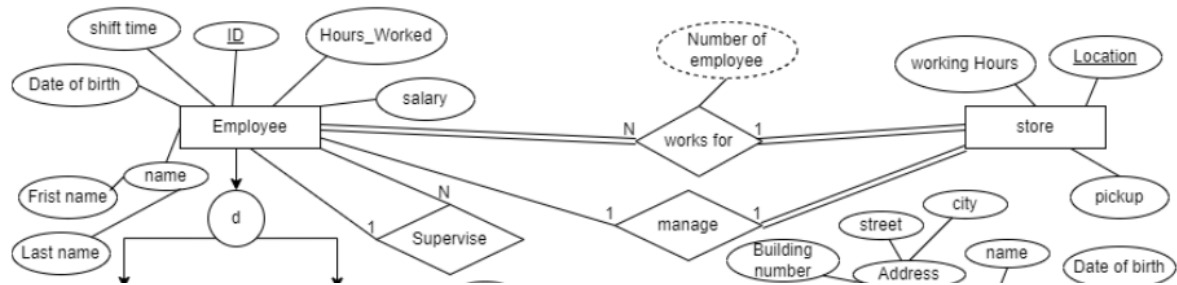

3.2 Mapping of Weak Entity Types**Warranty:**

<u>DSerialNo</u>	<u>type</u>	cost	expiration_date
------------------	-------------	------	-----------------

FK DSerialNo. → Device serial_number.

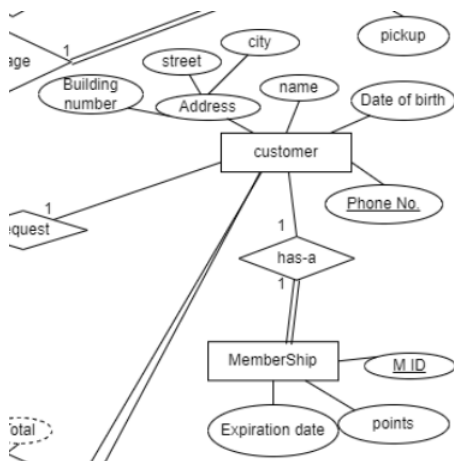

3.3 Mapping of Binary 1-1 Relationship Types

Store:

working_hours	<u>storeNum</u>	mgr_ID	pick_up
---------------	-----------------	--------	---------

FK mgr_ID → Employee ID.

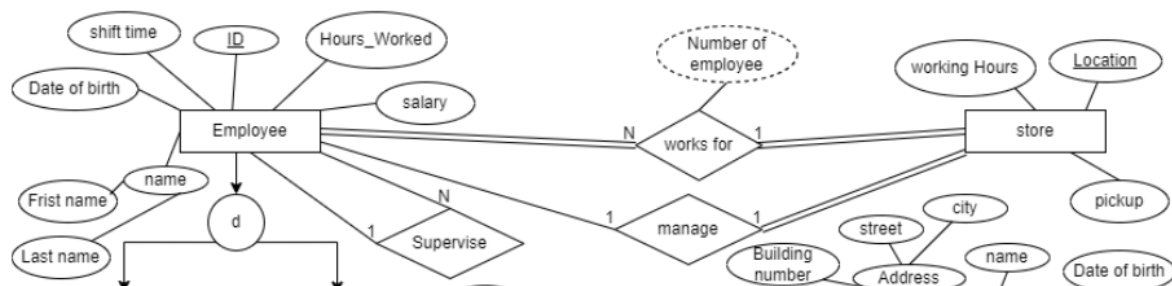

Membership:

CphoneNo	<u>MID</u>	expiration_date	points
----------	------------	-----------------	--------

FK CphoneNo. → Customer phone_number

3.4 Mapping of Binary 1-N Relationship Types

Employee:

<u>ID</u>	Fname	Lname	Date of birth	hours worked	Shift time	salary	store_loc	super_ID
-----------	-------	-------	---------------	--------------	------------	--------	-----------	----------

FK store_loc → Store storeNum.

FK super_ID → Employee ID.

Delivery:

<u>orderNo</u>	estimated_date	delivery_fee	package_weight	driver_licenseNo
----------------	----------------	--------------	----------------	------------------

FK driver_licenseNo → Delivery person driver_licenseNo

Services:

<u>SID</u>	type	duration	cost	EID	CPhoneNo
------------	------	----------	------	-----	----------

FK EID → Technician EID

FK CPhoneNo → Customer phone_number

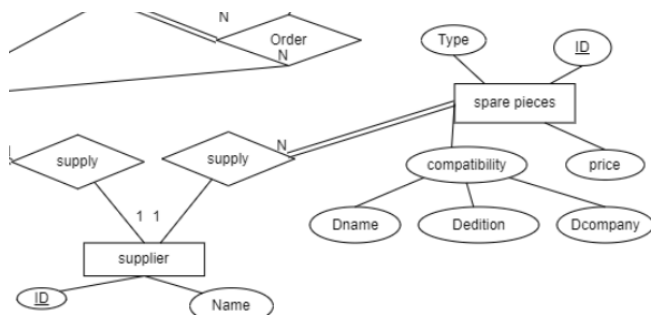

Purchases:

Unlike other mapping in this subsection, for the **purchases** relation we opted to use a Relationship relation (cross referencing relation) to avoid as many null values as possible since the Relationship is partial on both sides.

<u>DSerial number</u>	CPhone	p_method	p_time
-----------------------	--------	----------	--------

FK CPhone → Customer phone_number

FK Dserial_number → Device Serial_number

Spare pieces:

<u>ID</u>	Dname	Dedition	Dcompany	Price	sup_ID
-----------	-------	----------	----------	-------	--------

FK sup_ID → Supplier ID.

3.5 Mapping of Binary M-N Relationship Types

No changes in the schema because there are no M-N relationships.

3.6 Mapping of Multivalued Attributes

Degrees:

<u>EID</u>	<u>Tdegree</u>
------------	----------------

FK EID → Technician EID.

3.7 Mapping of N-ary Relationship Types

Order:

<u>orderNo</u>	<u>DSerialNo</u>	<u>CPhoneNo</u>
----------------	------------------	-----------------

FK orderNo → Delivery orderNo

FK DSerialNo → Device serial_number

FK CPhoneNo → Customer phone_number

3.9 Schema Diagram

Employee (ID, Fname, Lname, Date_of_birth, Hours_worked, Shift_time, salary, storeNum, super_ID).

FK storeNum → Store storeNum.

FK super_ID → Employee ID.

Technician (EID).

FK EID → Employee ID.

Delivery person (dirver_licenseNo, EID).

FK EID → Employee ID.

Store (working_hours, storeNum, mgr_ID, pick_up).

FK mgr_ID → Employee ID.

Customer (Phone_number, name, Date_of_birth, City, street, Building_number).

Delivery (orderNo., estimated_date, delivery_date, package_weight, EID)

FK EID → Delivery person EID.

Membership (CphoneNo, MID, expiration_date, points).

FK CphoneNo → Customer phone_number

Services (SID, type, duration, cost, EID, CphoneNo).

FK EID → Technician EID.

FK CPhoneNo → Customer phone_number.

Device (Serial_number, name, type, company, color, price, storage, edition, sup_ID).

FK CPhone → Customer phone_number.

FK sup_ID → Supplier ID.

Purchases (DSerial_number, CPhone, p_method, p_time).

FK CPhone → Customer phone_number.

FK Dserial_number → Device Serial_number.

Spare pieces (ID, Dname, Dedition, Dcompany, Price, sup_ID).

FK sup_ID → Supplier ID.

Supplier (ID, name).

Warranty (DSerialNo, type, cost, expiration_date).

FK DSerialNo → Device serial_number.

Degrees (EID, Tdegree).

FK EID → Technician EID.

Order (orderNo, DSerialNo, CPhoneNo).

FK orderNo → Delivery orderNo

FK DSerialNo → Device serial_number

FK CPhoneNo → Customer phone_number

4 Normalization

4.1 First Normal Form

The relation Schema is in 1NF as all attributes' values are atomic, meaning that there are no composite attributes, multivalued attributes, or nested relations.

4.2 Second Normal Form

Disallows partial dependency. Therefore, we will study the Functional Dependencies(FD) of each relation in the schema and determine whether it's a Full FD or a Partial FD.

Employee:

Full Functional Dependency

<u>ID</u>	Fname	Lname	Date of birth	Hours worked	Shift time	salary	storeNum	super_ID
	↑	↑	↑	↑	↑	↑	↑	↑

Technician:

Full Functional Dependency

<u>EID</u>

Delivery Person:

Full Functional Dependency

Store:

Full Functional Dependency

Customer:

Full Functional Dependency

Delivery:

Full Functional Dependency

Membership:

Full Functional Dependency

Services:

Full Functional Dependency

Device:

Full Functional Dependency

<u>Serial_number</u>	name	type	company	color	price	storage	edition	sup_ID
----------------------	------	------	---------	-------	-------	---------	---------	--------

Purchases:

Full Functional Dependency

<u>DSerial_number</u>	CPhone	p_method	p_time
-----------------------	--------	----------	--------

Spare pieces:

Full Functional Dependency

<u>ID</u>	Dname	Dedition	Dcompany	Price	sup_ID
-----------	-------	----------	----------	-------	--------

Supplier:

Full Functional Dependency

<u>ID</u>	name
-----------	------

Warranty:

Full Functional Dependency.

The cost depends on both the type of the warranty and the device serial number, because the type is the percentage of the device price that will determine the final cost of the warranty.

Ex: device price: 3500 SR, type: 0.15 → cost = 3500*0.15 = 525 SR.

<u>DSerialNo</u>	<u>type</u>	cost	expiration_date
------------------	-------------	------	-----------------

Degrees:

Full Functional Dependency

<u>EID</u>	<u>Tdegree</u>
------------	----------------

Order:

Full Functional Dependency

<u>orderNo</u>	<u>DSerialNo</u>	<u>CPhoneNo</u>
----------------	------------------	-----------------

The Schema is in Second Normal Form as there are no Partial Dependencies.

4.3 Third Normal Form

Looking at the schema and FDs in section 4.2, we can conclude that the schema is in the 3rd normal form because:

1. All attributes depend on the key only.
2. There is no transitive dependency.

5 Final DB Schema Diagram

Employee (ID, Fname, Lname, Date_of_birth, Hours_worked, Shift_time, salary, storeNum, super_ID).

FK storeNum → Store storeNum

FK super_ID → Employee ID.

Technician (EID).

FK EID → Employee ID.

Delivery person (dirver_licenseNo., EID).

FK EID → Employee ID.

Store (working_hours, storeNum, mgr_ID, pick_up).

FK mgr_ID → Employee ID.

Customer (Phone_number, name, Date_of_birth, City, street, Building_number).

Delivery (orderNo., estimated_date, delivery_fee, package_weight, EID)

FK EID → Delivery person EID.

Membership (CphoneNo., MID, expiration_date, points).

FK CphoneNo. → Customer phone_number

Services (SID, type, duration, cost, EID, CphoneNo.).

FK EID → Technician EID.

FK CPhoneNo. → Customer phone_number.

Device (Serial_number, name, type, company, color, price, storage, edition, sup_ID).

FK CPhone → Customer phone_number.

FK sup_ID → Supplier ID.

Purchases (DSerial_number, CPhone, p_method, p_time).

FK CPhone → Customer phone_number.

FK Dserial_number → Device Serial_number.

Spare pieces (ID, Dname, Dedition, Dcompany, Price, sup_ID).

FK sup_ID → Supplier ID.

Supplier (ID, name).

Warranty (DSerialNo., type, cost, expiration_date).

FK DSerialNo. → Device serial_number.

Degrees (EID, Tdegree).

FK EID → Technician EID.

Order (orderNo., DSerialNo., CPhoneNo.).

FK orderNo → Delivery orderNo.

FK DSerialNo. → Device serial_number.

FK CPhoneNo. → Customer phone_number.

No changes have been made.

PART III: Implementation

6 Table Creation Script

6.1 <STORE> TABLE

```
CREATE TABLE STORE (  
  
storeNum VARCHAR(2) NOT NULL PRIMARY KEY,  
  
working_Hours VARCHAR(50),  
  
mgr_ID NUMBER(10) UNIQUE,  
  
Pick_up VARCHAR(3));  
  
CREATE TABLE STORE  
(  
    storeNum VARCHAR(2) NOT NULL PRIMARY KEY,  
    working_Hours VARCHAR(50),  
    mgr_ID Number(10),  
    Pick_up VARCHAR(3)  
)
```

Table created.

6.2 <EMPLOYEE> TABLE

```
CREATE TABLE EMPLOYEE (  
  ID NUMBER(10) NOT NULL PRIMARY KEY,

8 Queries and Transactions

8.1 <Total Cost>

Query in Natural Language (English)

This query will retrieve the total cost for the order with the additional services

SQL Script

```
SELECT
    o.orderNO
```

```

,r.Delivery_fee
,v.Serial_number
,v.price
,v.price+(SELECT s.cost FROM SERVICES as s )
FROM
DELIVERY as r
,DEVICE as v
,ORDERS as o

```

Caption of the First Five Rows of the Output

8.2 <Discount>

Query in Natural Language (English)

This Query calculate discount for the customer based on the membership points

SQL Script

```

SELECT
    d.price
    ,d.price-(SELECT m.points FROM MEMBERSHIP as m)/100
    as PriceAfterDiscount
FROM
    DEVICE as d
WHERE EXISTS
    (SELECT
        o. CphoneNo
        ,c. Phone_number
    FROM
        ORDERS as o
        ,CUSTOMER as c
    WHERE
        o. CphoneNo=c. Phone_number );

```

Caption of the First Five Rows of the Output

8.3 < Availability >

Query in Natural Language (English)

This query will check the availability for a device or a spare piece across all stores.

SQL Script

```
SELECT *  
FROM DEVICE  
GROUP BY DEVICE.name;
```

Caption of the First Five Rows of the Output

8.4 <opened store>

Query in Natural Language (English)

This query will retrieve all stores that are open at certain time

SQL Script

```
SELECT working_Hours, storeNum  
FROM STORE
```

Caption of the First Five Rows of the Output

8.5 <due today>

Query in Natural Language (English)

This query will return the deliveries are due today with assigned Delivery Person's employee ID.

SQL Script

```
SELECT  
    d. orderNo  
    ,d.Estimated_date  
    ,d. Delivery_fee  
    ,d.EID,v.price  
    ,p. driver_licenseNo
```

```

        ,e.Fname,e.Lname
FROM
    DELIVERY as d
    , DELIVERY_PERSON as p
    ,EMPLOYEE as e
    ,DEVICE as v
WHERE
    Estimated_date =GETDATE() ;

```

Caption of the First Five Rows of the Output

8.6 <Order for delivery person>

Query in Natural Language (English)

This query retrieve table of all orders for specific Delivery person

SQL Script

```

SELECT
    d.orderNo
    , d.Estimated_date
    , d.Delivery_fee
    , d.Package_weight
FROM
    DELIVERY as d
    ,DELIVERY_PERSON as p
WHERE
    d.EID=p.EID ;

```

Caption of the First Five Rows of the Output

8.7 <Services>

Query in Natural Language (English)

The Services query will retrieve all services with pick-up dates that are within a week along with their designated Technician.

SQL Script

```
SELECT
    s.SID,s.EID
    ,s.duration
    ,t.EID
    ,e.Fname
    ,e.Lname
FROM
    SERVICES as s
    , TECHNICIAN as t
    ,EMPLOYEE as e
WHERE
    s.duration<8 AND
    s.EID = t.EID AND e.ID= t.EID
;
```

Caption of the First Five Rows of the Output

8.7 <Customers>

Query in Natural Language (English)

The customer query will return all customers who either purchased or ordered a device that includes an active warranty .

SQL Script

```
SELECT
    c.Name,
    c.Phone_number,
    o.CPhoneNo,
    o.Dserial_number,
    d.Serial_number,
    w.Dserial_number
FROM
    CUSTOMER as c,
    OREDERS as o,
    DEVICE as d,
    WARRANTY as w
WHERE
    c.Phone_number = o.CPhoneNo
    AND o.Dserial_number = d.Serial_number
    AND d.Serial_number = w.Dserial_number;
```

Caption of the First Five Rows of the Output

8.6 Update Example

Update in Natural Language (English)

Renew customers' membership by updating the expiration date and incrementing the points of the customer.

SQL Script

```
UPDATE
    MEMBERSHIP
SET
    points=points +1 ;

UPDATE
    MEMBERSHIP
SET
    expiration_date= expiration_date+1 ;
```
